

# Operating Systems

Eric Lo

## 1. Overview of an Operating System

# What is an OS?

- An OS
  - Includes a **program**
    - called “**kernel**” (e.g., kernel.exe)
      - which manages all the physical devices (e.g., CPU, RAM and hard disk)
      - exposes some functions as **system calls** for others to configure the kernel or build things (e.g., C library) on top
  - Includes some more **programs**
    - called “**drivers**”
      - which handles the interaction between the kernel and the external devices (e.g., keyboard)
    - called a “**shell**”
      - Which renders a simple command-line user interface with a full set of commands
    - ...
  - Includes some “optional” **programs**
    - GUI, Browser, Paintbrush, ...

```
metalx1000@grml /tmp % cat file2.txt
There are no Tabs on This line
test  this is a test  yes
No tabs
this is      new      test
this is a    test     for    every one
no Tabs
metalx1000@grml /tmp % grep '$\t' file2.txt
test  this is a test  yes
this is      new      test
this is a    test     for    every one
metalx1000@grml /tmp % grep '\t' file2.txt
test  this is a test  yes
No tabs
this is      new      test
this is a    test     for    every one
metalx1000@grml /tmp % grep '\t' file2.txt
test  this is a test  yes
this is      new      test
this is a    test     for    every one
metalx1000@grml /tmp %
```

# What is a process?

- A process is an **execution instance** of a program.
  - More than one process can execute the same program code

Let's consider the following two commands

Command A	<code>ls -R /</code>	Recursively print the directory entries, starting from the directory '/'
Command B	<code>ls -R /home</code>	Recursively print the directory entries, starting from the directory '/home'

They are **2** different processes

# A process is more than a program

- A process has **states** concerning the execution.  
E.g.,
  - which line of codes it is running;
  - how much time left before returning the CPU to the others
- Commands about processes
  - e.g., **ps** & **top**.

# Process-Related Tools

- The tool “**ps**” can report a vast amount of information about every process in the system
  - Try “**ps -ef**”.

This column shows the unique identification number of a process, called **Process ID**, or PID for short.

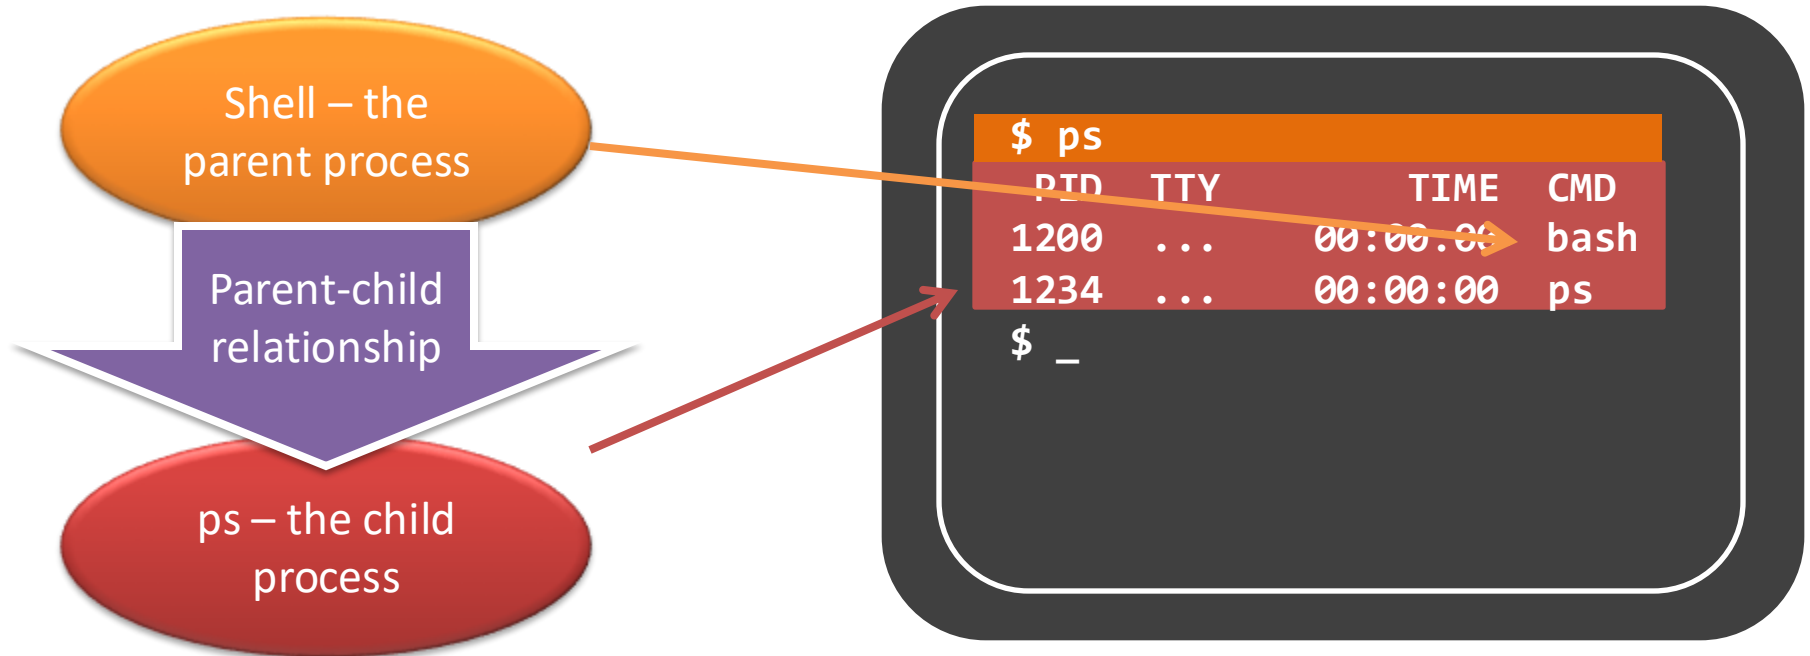

Hint: you can treat **ps** as the short-form of “**p**rocess **s**tatus”

By the way, this is called **shell**.

```
$ ps
  PID  TTY      TIME  CMD
 1200  ...    00:00:00 bash
 1234  ...    00:00:00 ps
$ _
```

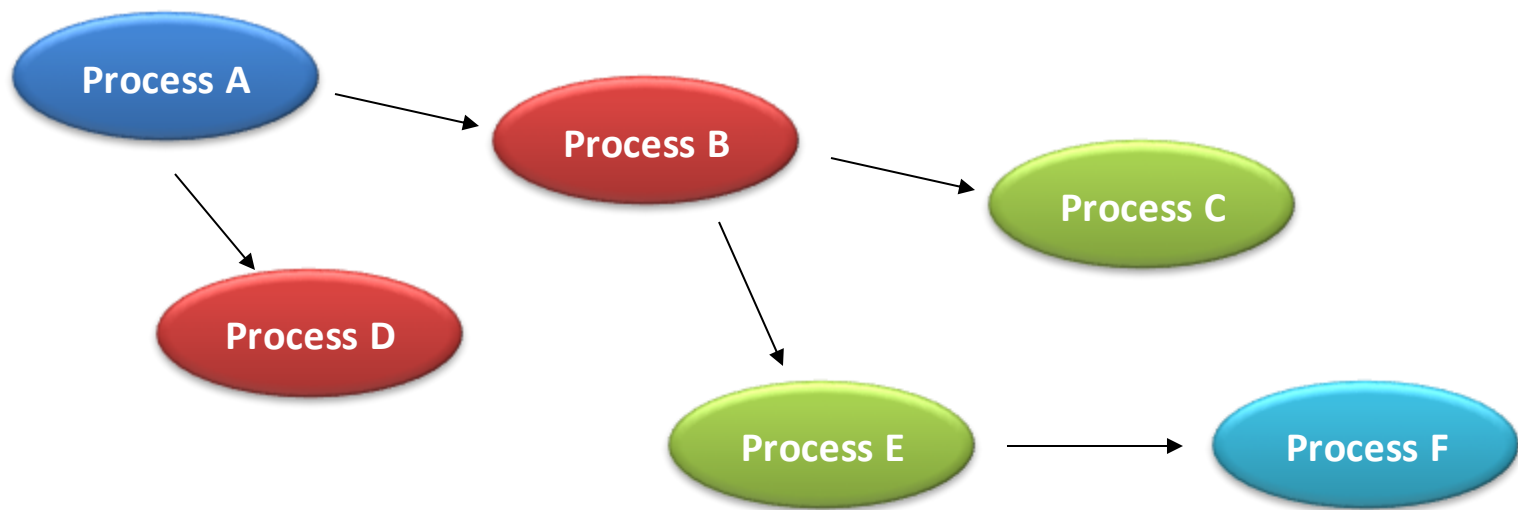

# What is a Shell?

- A shell is a program
- You open a “terminal”, which actually launches a “shell” process
  - E.g., bash in Linux
- Written in C
  - use `getchar()` (to get your command “ps”)
  - syntax checking
  - invoke a function `fork()` (a **system call**) to create a new process
    - i.e., becoming a **child process** of the shell.
  - Ask the the child process to `exec()` the program “ps”.

# Process hierarchy

- Process relationship:
  - A parent process will have its child processes.
  - Also, a child process will have its child processes.
  - This forms a **tree hierarchy**.

E.g., “Process E” is the shell and “Process F” is “**ps**”.

# What is a system call?

- System call
  - Is a function call.
  - Exposed by the **kernel**.
  - Abstract away most low-level details.
    - Do you know how to read an input from keyboard?

```
int add_function(int a, int b) {  
    return (a + b);  
}
```

Function  
implementation.

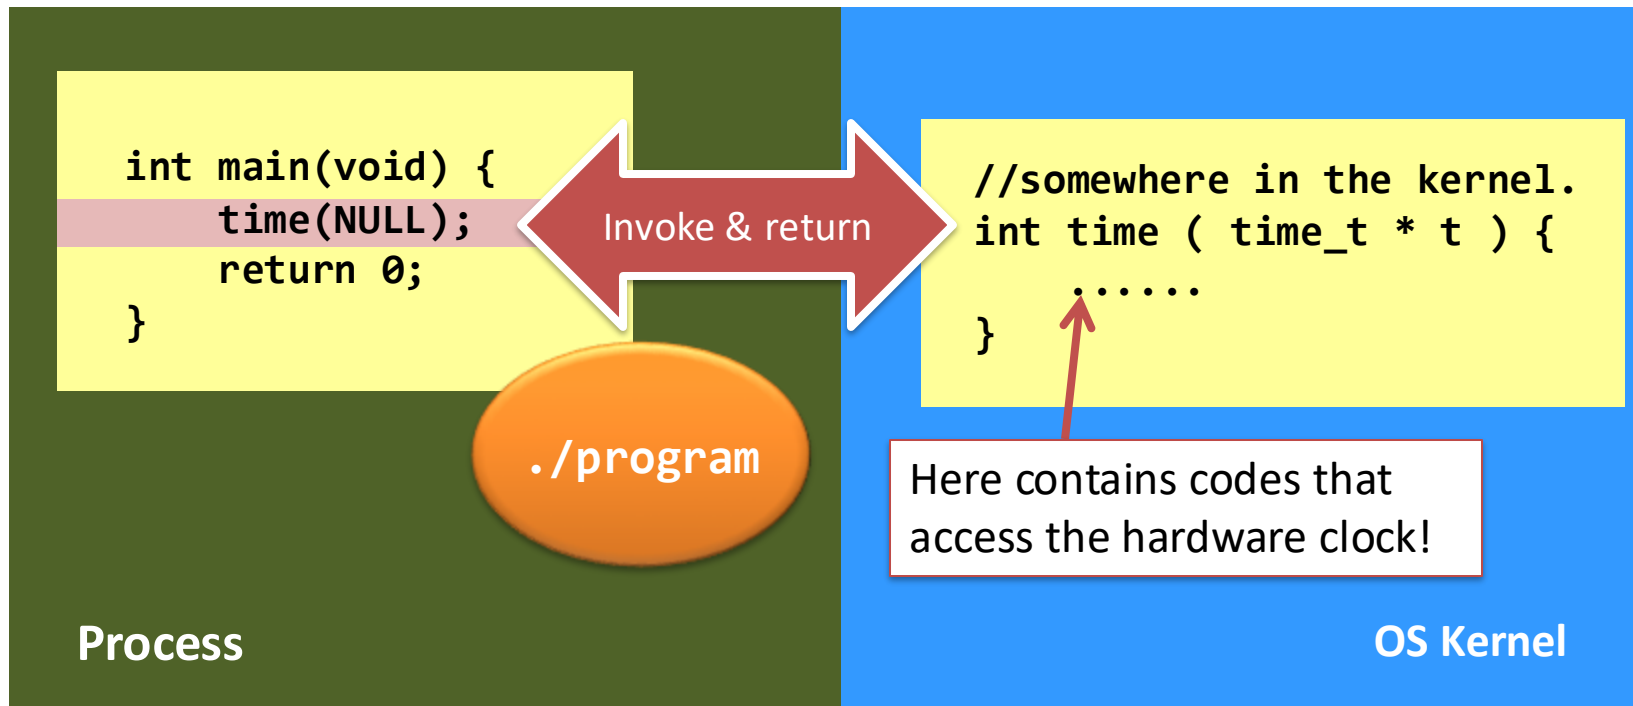

```
int main(void) {  
    int result;  
    result = add_function(a,b);  
    return 0;  
}
```

This is a  
function call.

```
// this is a dummy example...
```

# Interacting with the OS

# System calls

- Categorizing system calls as follows:

<b>Process</b>	<b>File System</b>	<b>Memory</b>
<b>Security</b>	<b>Device</b>	<b>Information</b>

# System calls

- How can we know if a “function” is a system call?
  - Read the man page “**syscalls**” under Linux.
- Without reading the man pages, guess which of the following is/are system call(s)?

Name	Yes/No?
printf() & scanf()	No
malloc() & free()	No
fopen() & fclose()	No
mkdir() & rmdir()	Yes
chown() & chmod()	Yes

Who are they?

# System calls VS Library function calls

- System call vs **Library call**
- Take **fopen()** as an example.
  - **fopen()** invokes the system call **open()**.
  - So, why people invented **fopen()**?
  - Because **open()** is too primitive and is not programmer-friendly!

Library call

```
fopen("hello.txt", "w");
```

System call

```
open("hello.txt", O_WRONLY | O_CREAT | O_TRUNC, 0666);
```

# System calls VS Library function calls

# What will we learn about processes?

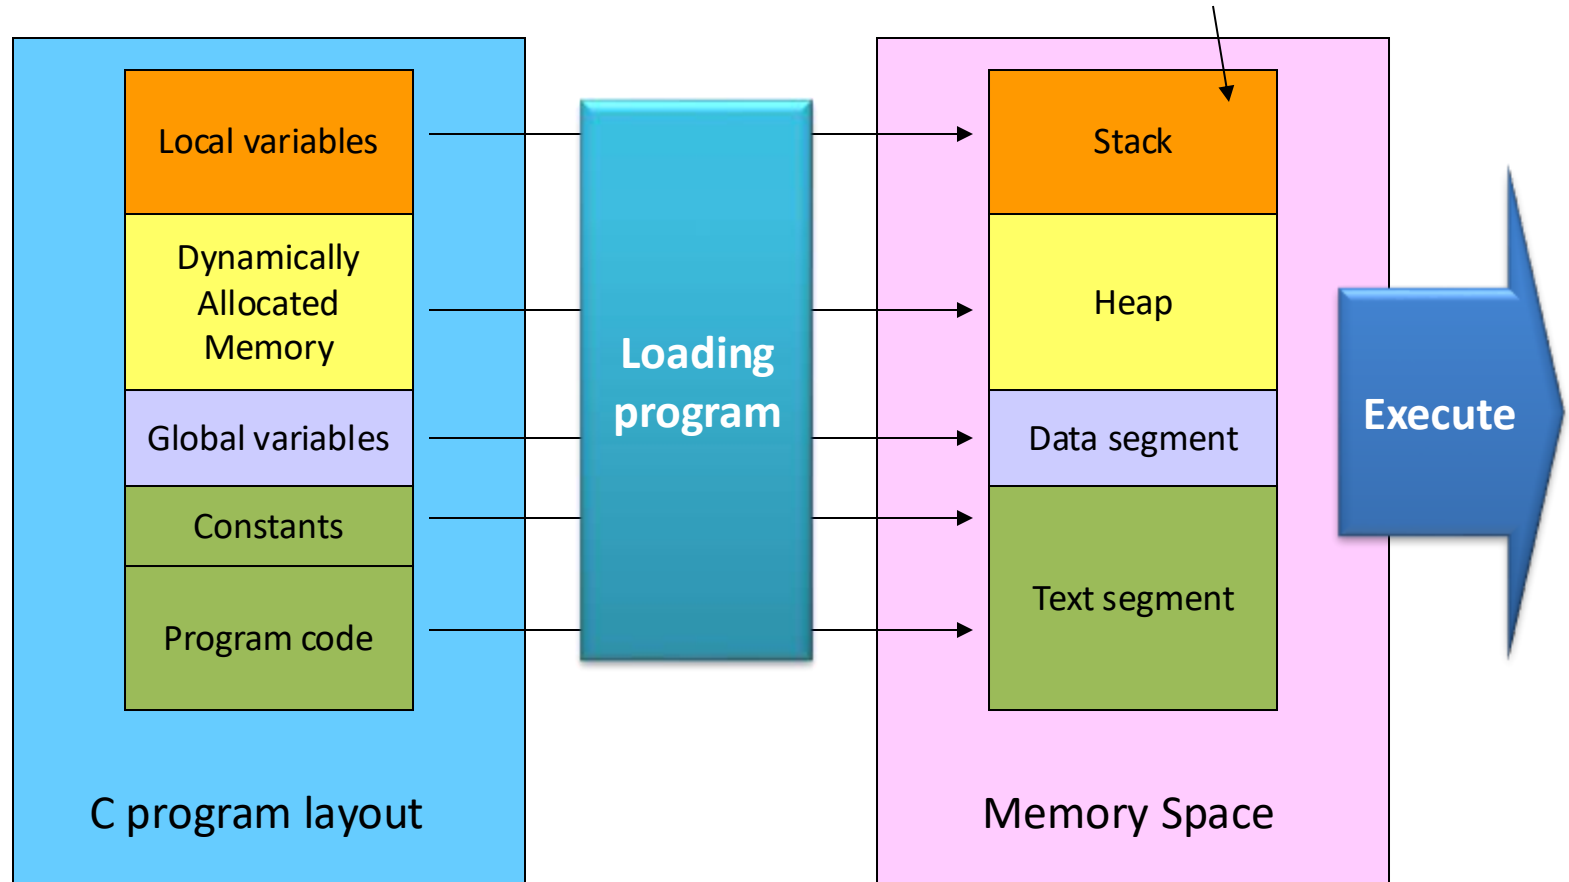

- System calls
  - How to program a simple, bare-bone shell?
- Lifecycle and Scheduling
  - How to create processes?
  - How to handle the death of the processes?
  - Which process shall get the core next?
- Signals
  - How to suspend a process?
  - A virus? We can make a program to play a song whenever you type **Ctrl+C**?
- Synchronization
  - How processes can cooperate to do useful work together?

# Introduction to Operating System Components

## Memory

# Process' Memory

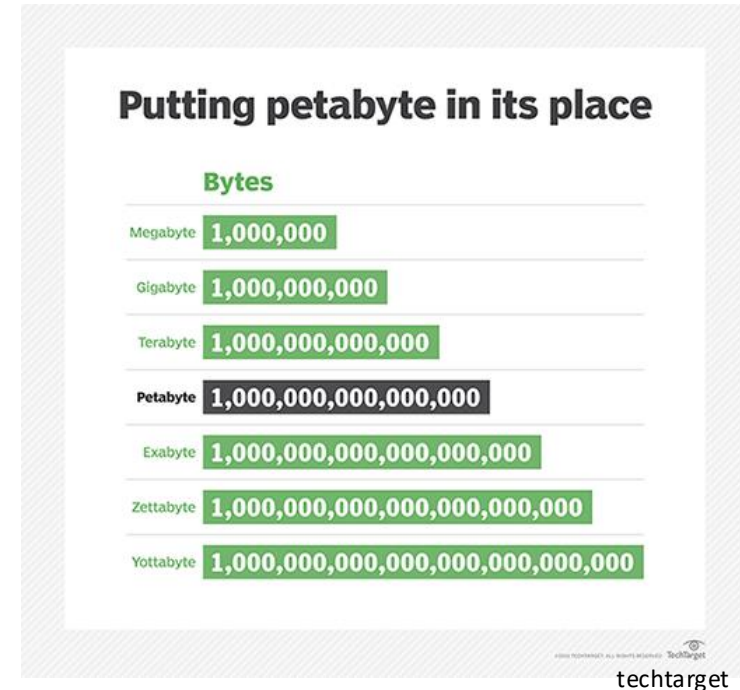

BTW, this arrangement is called s\_\_\_\_\_!

# What will we learn about memory?

- Virtual memory
  - 1 process virtually owns **all**
    - $2^{32}$  RAM (=4GB) for 32-bit CPU
    - $2^{64}$  RAM (=16EB) for 64-bit CPU
      - Practically OS set it to be 256TB or 1PB
- Memory-related functions
  - E.g., how to write “**malloc()**”?
- Stack overflow
  - Why & when?
- RAM = 256MB
  - **malloc(16MB)**
  - How much free memory left?

# **Introduction to Operating System Components**

## **File System**

# What is a File System?

- Have you heard of...
  - FAT16, FAT32, NTFS, Ext3, Ext4, Btrfs, Juliet?
  - They are all file systems.
  - It is about how to organize your files in the storage device.

## Erase "SD-16GB"?

Erasing "SD-16GB" will permanently erase all data stored on it. You can't undo this action.

Name: SD-16GB

Format

✓ MS-DOS (FAT32)

Mac OS Extended (Journaled)

Mac OS Extended (Case-sensitive, Journaled)

MS-DOS (FAT)

ExFAT

Security Options.

# What is a File System?

- If a FS just lays your files one-by-one, consecutively, tightly, in your hard disk, is it good?
  - What if you increase the size of your file?
  - What's the performance of searching for a file?  $O(?)$
  - BTW, how to deal with directories?
